### How to use Risk Chain Model

Risk Chain Model (RCModel) Guide Ver1.0 최고

### **Case Study**

\*These are fictional case studies below and don't raise issues or assure for any company or AI service.

Case01.Recruitment AI (2021/07) 译了

# Case Study

### Case01 : Recruitment AI

- Define the "values and objectives to be achieved" by AI services -

This is an AI service used as reference information when judging the selection of documents for the entry sheet for the human resource recruitment department (HR dept.) in a global company, i.e., Company A.

The AI development department of Company A receives the past entry sheet data and results of pass/fail judgment from the HR dept. of Company A (including overseas group companies), which is a business user. The department created a learning model for judging the rates of pass/fail through machine learning (classification model).

- [Values & Objectives]
- Maintaining and improving the hiring level
- Reducing costs of recruitment
- Providing service for groups
- Corporate Social Responsibility (Fair Recruitment Activities)

It is evaluated based on the precision (the percentage of successful applicants who have passed an interview and have been offered a job), and 70% is set as the expected value. The precision is used as an evaluation index because the recall (the percentage of people who did not get a job offer because they did not pass the screening process by AI) is insufficient data for the examination.

The HR dept. of Company A reads the entry sheet (through an electronic file) of the applicant (both new graduates and mid-career graduates) into the learning model and can confirm the judgment result (pass/fail) of the AI on its own personal computer (using a browser). It should be noted that not only the pass/fail judgment but also the keyword affecting the judgment is highlighted and displayed in the entry sheet on the output screen. The person in charge of the HR dept. sets up a pass/fail judgment using the judgment of the AI as reference information, obtains the approval of the head of the personnel department, and notifies the applicant of the pass/fail judgment.

The real data stored are appropriately added as learning data at the time when the determination result of the pass/fail judgment is input, and the learning model is updated daily and reflected upon in the real environment. However, the AI model in the production environment is not automatically updated when the correct answer rate is less than 70% as a result of cross-validation testing during the learning process. The AI model stores versions from the previous year.
